

QUANTEC® and agriculture

Heart-shaped Potatoes

"When you sow love, joy will grow."
William Shakespeare

A QUANTEC® user sent the following story:

"During a particularly cold spell this past winter, our potato crops suffered severe frost damage. I took pictures of the damaged plants and made HealingSheets on the QUANTEC® to help the potato plants recover. We also sent messages of love and gratitude to the potato plants. About 60% of the plants recovered. (Other farmers in the region only recovered about 10% of their expected yield).

*The most unbelievable
of all was
that several of the
potatoes were
heart shaped when
we started to harvest.*

We have never heard of or seen heart-shaped potatoes before".

- QUANTEC®-Farmer

The potato land was already on the QUANTEC® before the frost. Additional healing sheets were made after the frost. Some of the HealingSheets read:

*'100% germination of seed'
'Perfect growth on all levels'
'The potatoes have fully recovered from frost damage'
'The potatoes are protected from all adverse weather conditions'*

Use of the QUANTEC® in commercial horticultural farming 2007-2010

I saw the use of the QUANTEC® as an aid and possible extension of life-energy on plants and trees. The QUANTEC® indeed proved to be an invaluable tool in the production of better quality crops, with more economical use of fertilizers and much less dependency on harmful pesticides. The most valuable contribution of the QUANTEC® in horticultural farming is its ability to restore balance in the soil, plants and nature in general. Experience showed, however, that balance is not restored all at once, but occur in stages and over a period of time. Some results obtained are described below:

Nutrients

After treatment with the QUANTEC®, plants and trees appeared more green, healthy and lush. Vegetables and fruit needed much less fertilizer and excellent quality crops were produced. The pH of the soil, which was extremely high in our area, came down to a level where maximum absorption of nutrients is possible.

Insects

The QUANTEC® is also invaluable in detecting harmful insects and sending out frequencies to attract natural predators to get rid of them. Photographs of problem areas were taken and fed into the computer, with the following results:

Locusts

During a particularly heavy locust plague, large flocks of locust-birds came that ate the locusts. Not all of them disappeared, but their numbers were considerably diminished and no poison needed to be used to save the crops.

Ants and termites

Ants and termites are a big problem, especially among citrus trees. Here again, large numbers of guinea fowl feed under the trees. Although the ant-problem is not solved altogether, the guinea fowl keeps it under control.

Corn crickets

During a corn cricket plague, the cattle egret came in enormous flocks, stayed for about two weeks and feasted on the crickets. They also got rid of a number of mice.

Pests and diseases can be detected before they get a chance to cause serious problems. With the help of the QUANTEC® it is only necessary to apply minimal measures, which are non-toxic and do not disturb the ecology.

Allies

With the help of the QUANTEC®, and the absence of toxic substances, allies such as bees and ladybirds are present at appropriate times.

Conclusion

The QUANTEC® device is without a doubt a huge asset in agriculture, where input costs have soared to levels where it is almost impossible to sustain. The QUANTEC® enables huge savings, while excellent quality crops are produced. It also assists in the marketing and selling of products.

Since we began using energy on citrus, we stopped using recommended pesticide spraying programmes. The only remedies used are crop oil to prevent scale and sulphur to keep some insects away. On average, a success rate of about 80% was achieved with individual trees treated by the QUANTEC® – these trees were in poor condition before and recovered completely after treatment. About 20% of trees recovered somewhat, but need further treatment. Among 11 000 trees treated only 2 trees did not recover at all and died.

Through the use of life-energy and the QUANTEC®, we have doubled our income every year for the past four years. We also had no problem marketing and selling the produce at very good prices. We even managed to sell products that would usually have been throw-outs.

The use of the QUANTEC® in agriculture is a continuous learning experience where constant changes can be expected and need reaction upon. The interaction between the operator and the target is of vital importance and requires dedication and perseverance. The end result is, however, more than rewarding.
